locating posts 123 are sequentially aligned with and are engaged to the locating recesses 25 of the plug base 2. Thus, the present invention can rotate through 360 degrees.

One end of the large pin 23 is an insertion end 231 and the other end thereof has a slight convex shape. This union end 232 resists against the vertical surface 1241 of the conductor element 124. Each of two sides of the union end 232 has a buckling edge 233. Thus, After the large pin 23 is inserted into one pin hole 22, the buckling edges 233 resists against the rear end of the pin hole 22, thereby enabling electrical connectivity between the body 1 and the plug base 2.

The small pin 24 has an insertion end 241 at one end thereof and a connection washer end 242 at another end thereof. The connection washer end 242 is formed by bending another end so as to resist against the vertical side 1251 of the contact element 125. After the small pin 24 is inserted into the pin hole 22, the connection washer end 242 resists against the inner side of the fastening hole 21.
